Artificial intelligence in ophthalmology

REVIEW

Curr Opin Ophthalmol 2026, 37:000-000
DOI:10.1097/ICU.0000000000001226

The evolving role of artificial intelligence in ophthalmology: basic science, translation, and clinical integration

Meghan N. Miller^a, David Hsu^b, Prashant D. Taylor^b and Matthew R. Starr^b

Purpose of review

Ophthalmology has emerged as the proving ground for medical artificial intelligence (AI) because of its **imaging-centric workflows, standardized data acquisition, and well defined clinical endpoints**. Recently, the field has started transitioning from narrowly trained, task-specific algorithms toward **multimodal models that are trained on large datasets and can be adapted to many tasks**. These models may **integrate information from images, text, and clinical data** and are increasingly trialed in real-world settings. This review examines recent advances and ongoing controversies in the use of AI as a basic science, translational, and clinical research tool in ophthalmology.

Multi-modal models and large-scale integration of images, clinical and omics data

REVIEW

Curr Opin Ophthalmol 2026, 37:236-243
DOI:10.1097/ICU.0000000000001209

Opportunities and challenges in leveraging multiomics and biobanks for vision science

Dolly Ann Padovani-Claudio^{a,b} and Lisa Bastarache^b

Purpose of review

Emerging biobank resources allow **large-scale integration of eye-specific phenotypes with clinical, genomic, and multiomic data**. This convergence enables unprecedented opportunities to systematically dissect the genetic architecture, epidemiology, and mechanistic pathways of both rare monogenic and common polygenic diseases. The review aims to critically examine how contemporary data extraction, multiomics, and analytic methodologies are reshaping disease classification, genetic discovery, and translational research in ophthalmology, while highlighting the associated challenges in leveraging these advanced tools.

Agentic Artificial Intelligence in Eye Banking: A Proposed Workflow

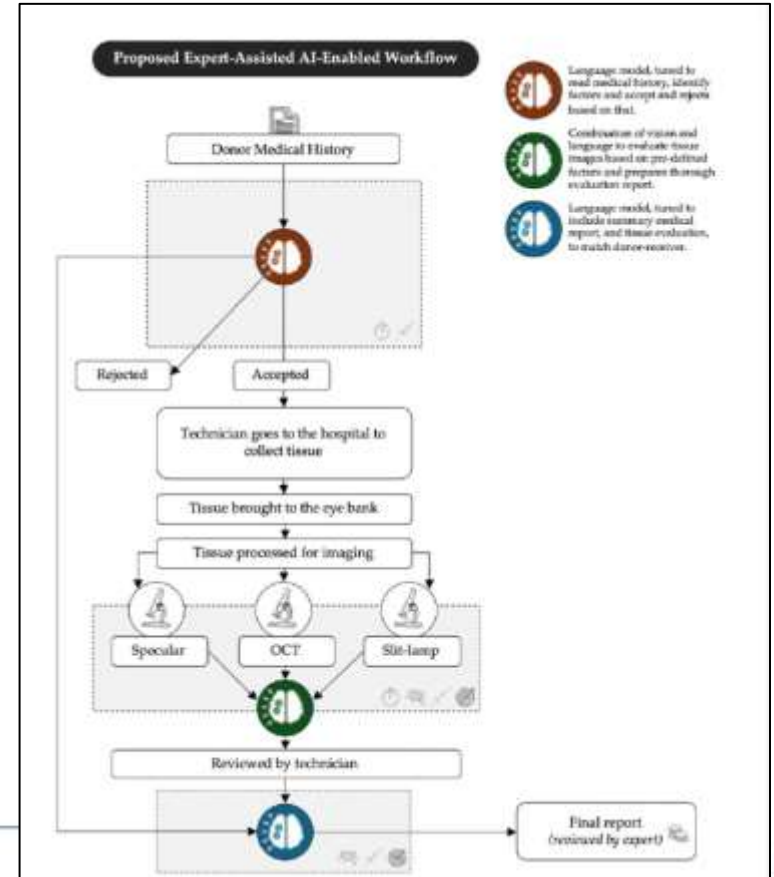

Ranit Karmakar, PhD,* Elizabeth Kassahun Kiros, MD, MPH,† Siddharth Nath, MD, PhD,‡
Pearse A. Keane, MD, MSc,‡ Krishna Kumar,§ John Lohmeier, CEFT,§ Shameema Sikder, MD,‡
Eric Meinecke, CEFT,¶ Chris Hanna, MBA, CEFT,|| and Allen O. Eghrari, MD, MPH†

Purpose: To develop an agentic artificial intelligence (AI) framework that streamlines and standardizes eye bank operations by automating donor screening, image analysis, and tissue suitability assessment under expert supervision.

transplantation. It carries implications for both limited resource settings and the broader context of transplantation medicine.

Key Words: artificial intelligence, AI, eye banking, specular microscopy

Standardization of **eye bank operations** by automating **donors' screening, image analysis, and tissue suitability assessment**

Be aware of large language models

- **ChatGPT** is a chatbot based on a **generative AI architecture** named **transformer**
 - GPT (Generative Pretrained Transformer) is a **large language model** trained with contents available online
 - The name alludes the purpose, that is, it transforms things (e.g. translation): **(input) text → (output) text**
- **ChatGPT does not know what it is talking about:**
 - It concatenates the most likely sequence of words to correctly answer the prompt, but:
it **does not understand** the prompt and it **does not know** the context for the answer
 - It is **not designed to create logically coherent, consistent, nor truth-based sentences**
(there is no mechanism for verifying truth and correctness)
- Since GPT is not based on truth or on reliable sources, it **can create** (formally flawless but) **completely FALSE texts**
 - It can create false documents, invent facts and statements, cite non-

What is NOT artificial intelligence

What artificial intelligence is, actually...

algorithm

What ~~artificial intelligence~~ is, actually:
just a set of instructions

What does it mean «to learn»?

- In order to learn, machines need to be **trained with data**
- Machine learning is a **computational/statistical tool** that can be used to **solve problems** and **make inference** on a wide range of problems
 - Thanks to their **huge processing power**, machines can quickly **highlight** or **find patterns in big data** that would have otherwise been missed by human beings
- The **fundamental goal** of is to **generalize beyond the training samples**, that is, to successfully interpret data that the algorithm has never “seen” before

The **task** you are trying to accomplish, i.e. the

The **type, quality** and **amount of data** that you

- There are different approaches to getting machines to learn, depending on:

The three main categories of machine

General
rules from
examples

Make
decisions
(trial and
error)

Identify
similarities

CLASSICAL MACHINE LEARNING

LABELS!

Data is pre-categorized
or numerical

SUPERVISED

Predict
a category

CLASSIFICATION

«Divide the socks by color»

Predict
a number

REGRESSION

«Divide the ties by length»

Data is not labeled
in any way

UNSUPERVISED

Divide
by similarity

CLUSTERING

«Split up similar clothing
into stacks»

Identify sequences

ASSOCIATION

«Find what clothes I often
wear together»

DIMENSION REDUCTION (generalization)

«Make the best outfits from the given clothes»

NO LABELS

- Availability of **ground truth data**
- Measurability of models' accuracy

...

Data, features, labels

- A **feature** is a characteristic or a measurable property of the data
 - Features can be **quantitative** (numeric values) or **qualitative** (string labels)
- For instance, a quantitative **feature** in OCT could

From: Evaluation of thickness of individual macular retinal layers in diabetic eyes from optical coherence tomography

Scientific Reports 14, Article number: 17909 (2024)

The **label** is a **chosen feature**, used for training and for model evaluation.

For instance, **health status**:

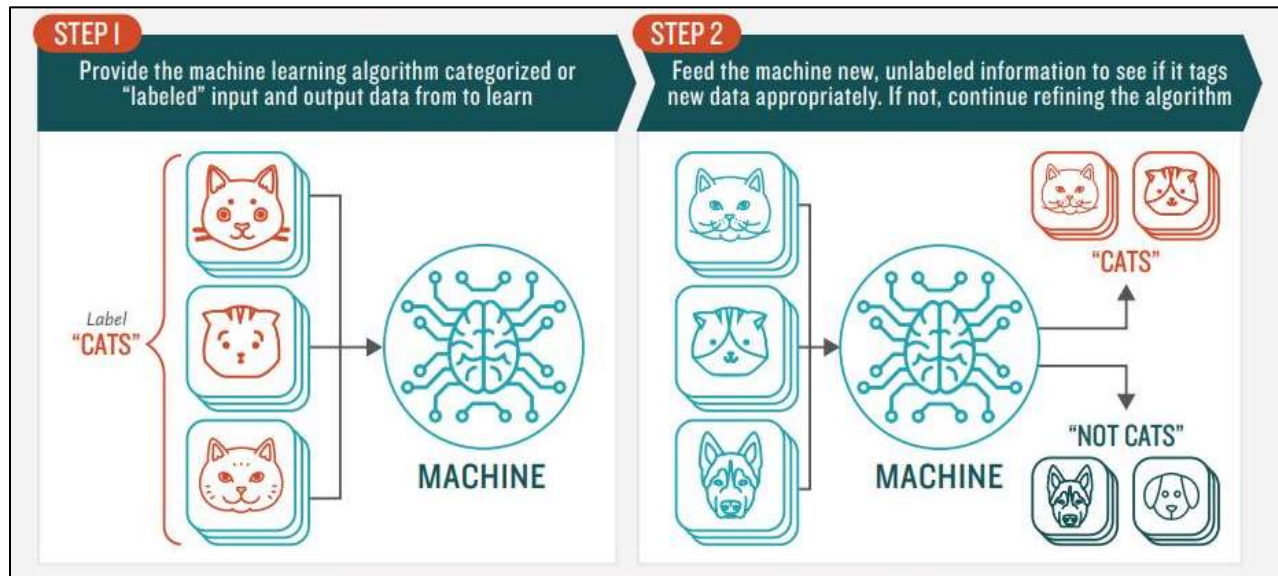

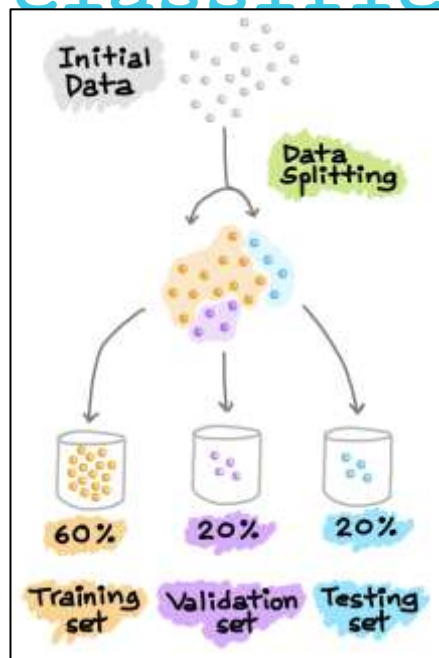

- Patient with multiple sclerosis
- Healthy control

The importance of labels...

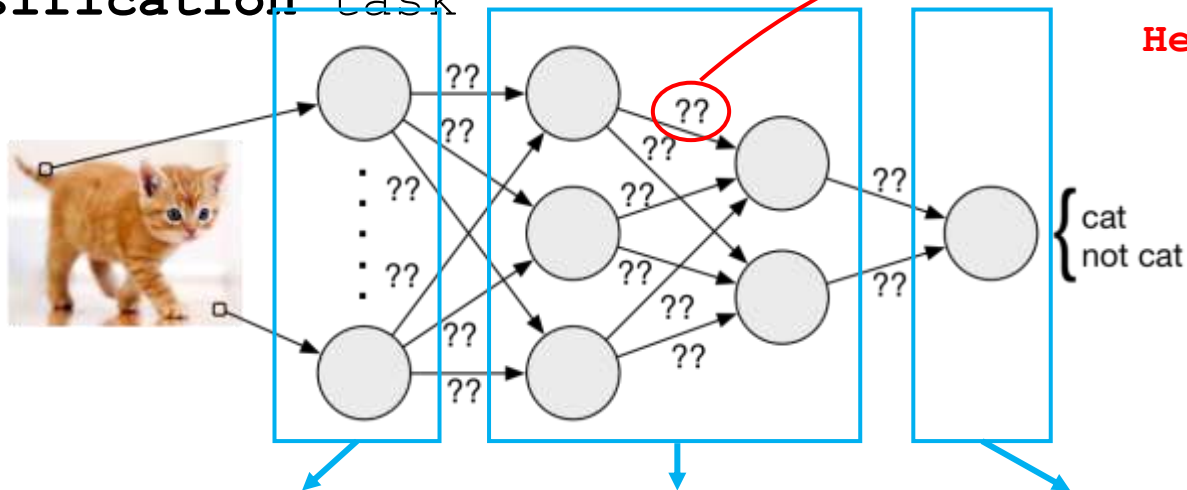

How supervised learning works: classification task

Supervised learning – Neural networks

- A **neural network** consists of layers of interconnected **neurons** that cooperate to solve a **classification** task

Here is learning!

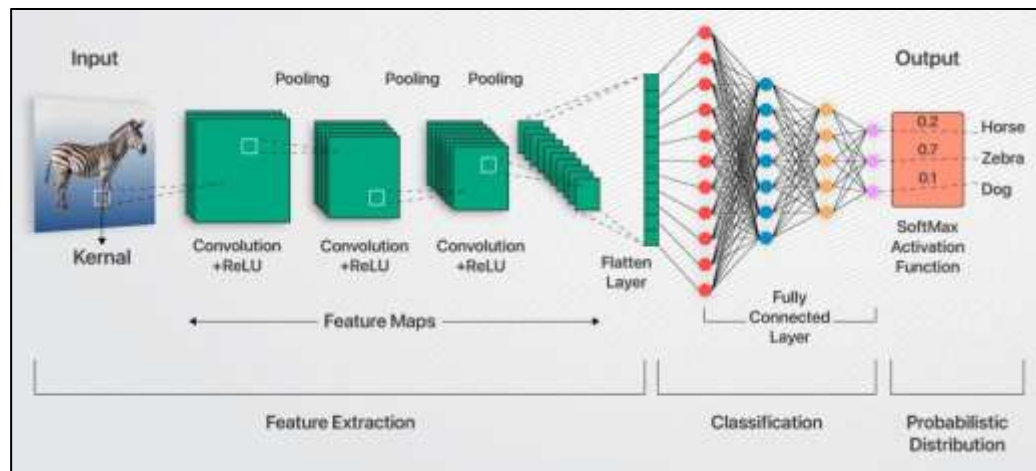

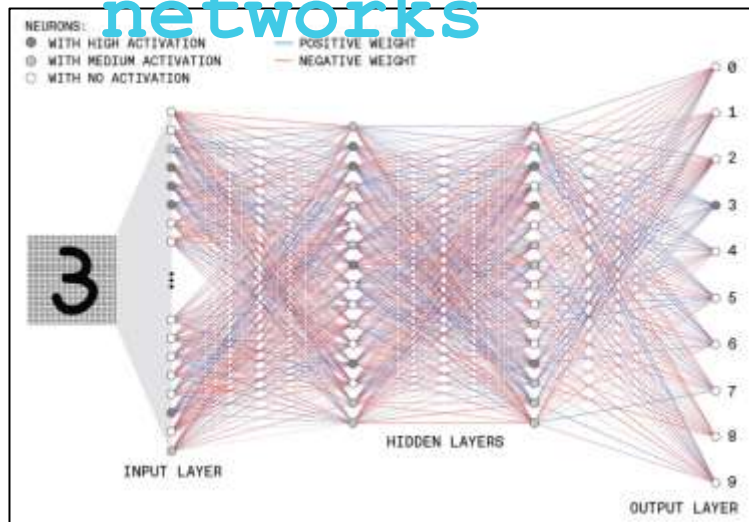

Input layer: no computation is done here, the input neurons just pass the information

Hidden layer(s): hidden neurons transfer the weights from the input

Output layer: an "activation function" maps the network results to the output class

Supervised learning – Deep neural networks

What *might* go wrong in neural network learning?

- Which neural network **architecture**?
 - How many layers? How many neurons?
- Which **activation function**?
- Which **loss function**?
- Which **optimization algorithm**?
- Which data?
 - How many **samples**?
 - How many **features**?
 - Are the **labels** reliable/accurate?
- ...

10 Most Common Loss Functions in Machine Learning blog.dailydesire.it/2016/05/

Loss Function Name	Description	Function
Regression Loss Functions		
Mean Squared Error	Average squared errors between actual and predicted. Also called L2 Loss.	$C_{MSE} = \frac{1}{2} \sum_{i=1}^n (y_i - \hat{y}_i)^2$
Mean Absolute Error	Average absolute errors between actual and predicted. Also called L1 Loss.	$C_{MAE} = \frac{1}{2} \sum_{i=1}^n y_i - \hat{y}_i $
Mean Squared Error	Average squared errors between actual and predicted. Also called L2 Loss.	$C_{MSE} = \frac{1}{2} \sum_{i=1}^n (y_i - \hat{y}_i)^2$
Root Mean Squared Error	Square root of MSE. Loss and derivative become more stable.	$C_{RMSE} = \sqrt{\frac{1}{2} \sum_{i=1}^n (y_i - \hat{y}_i)^2}$
Huber Loss	A combination of MSE and MAE. It is piecewise quadratic and linear.	$C_{Huber} = \begin{cases} \frac{1}{2} (y_i - \hat{y}_i)^2 & y_i - \hat{y}_i \leq \delta \\ \delta y_i - \hat{y}_i - \frac{\delta^2}{2} & y_i - \hat{y}_i > \delta \end{cases}$
Log Cost Loss	Similar to Mean Squared Error, but with logarithmic regularization.	$C_{LogCost} = \frac{1}{2} \sum_{i=1}^n \log(1 + (y_i - \hat{y}_i)^2)$
Classification Loss Functions (Binary + Multi-class)		
Binary Cross Entropy (BCE)	Loss function for binary classification tasks.	$C_{BCE} = - \sum_{i=1}^n [y_i \log(\hat{y}_i) + (1 - y_i) \log(1 - \hat{y}_i)]$
Huber Loss	Combines cross entropy and L2 loss.	$C_{Huber} = \max(0, 1 - f(\hat{y}_i) - y_i)$
Cross Entropy Loss	Extension of BCE loss to multi-class classification.	$C_{CE} = - \sum_{i=1}^n \sum_{c=1}^C y_{i,c} \log(\hat{y}_{i,c})$
F1 Divergence	Measures the divergence between empirical and true probability distributions.	$C_{F1} = \sum_{i=1}^n \sum_{c=1}^C y_{i,c} \log \left(\frac{y_{i,c}}{\hat{y}_{i,c}} \right)$

Neural Network Activation Functions: a small subset!

ReLU $\max(0, x)$	GELU $\frac{1}{2} (1 + \text{erf}(\sqrt{x})) \cdot x$	PReLU $\max(0, x)$
ELU $\begin{cases} x & x \geq 0 \\ \alpha \exp(-x) - 1 & x < 0 \end{cases}$	Swish $\frac{x}{1 + \exp(-x)}$	SELU $\alpha \max(0, x) + \min(0, \beta \exp(-x) - 1)$
SoftPlus $\frac{1}{2} \log(1 + \exp(x))$	Mish $x \tanh\left(\frac{1}{2} \log(1 + \exp(x))\right)$	RReLU $\begin{cases} x & \text{if } x < 0 \\ \alpha x & \text{if } 0 \leq x < \beta \\ 0 & \text{otherwise} \end{cases}$
HardSwish $\begin{cases} 0 & x \leq -3 \\ x & -3 < x < 3 \\ 0 & \text{if } x \geq 3 \end{cases}$	Sigmoid $\frac{1}{1 + \exp(-x)}$	SoftSign $\frac{x}{1 + x }$
Tanh $\tanh(x)$	Hard tanh $\begin{cases} 1 & x \geq 2 \\ 0 & -2 \leq x \leq 2 \\ -1 & \text{otherwise} \end{cases}$	Hard Sigmoid $\begin{cases} 0 & \text{if } x \leq -2 \\ x & \text{if } -2 < x < 2 \\ 1 & \text{if } x \geq 2 \end{cases}$
Tanh Shrink $x - \tanh(x)$	Soft Shrink $\begin{cases} -x - 1 & \text{if } x > 1 \\ x - 1 & \text{if } x < -1 \\ 0 & \text{otherwise} \end{cases}$	Hard Shrink $\begin{cases} 0 & \text{if } x > 1 \\ x & \text{if } -1 < x < 1 \\ 0 & \text{otherwise} \end{cases}$

How to evaluate a neural network model?

- Given a classification of a specific data set, we can obtain:
true positives and **negatives** (TP, TN), **false positives** and **negatives** (FP, FN)

Metric	Formula	Interpretation
Accuracy	$\frac{TP + TN}{TP + TN + FP + FN}$	Overall performance of model
Precision	$\frac{TP}{TP + FP}$	How accurate the positive predictions are
Recall Sensitivity	$\frac{TP}{TP + FN}$	Coverage of actual positive sample
Specificity	$\frac{TN}{TN + FP}$	Coverage of actual negative sample
F1 score	$\frac{2TP}{2TP + FP + FN}$	Hybrid metric useful for unbalanced classes

goodness of a

Accuracy measures the proportion of correct predictions out of all predictions

Sensitivity measures the proportion of actual positives that are correctly identified as such

Specificity measures the proportion of actual negatives that are correctly identified as such

Thanks to labels!

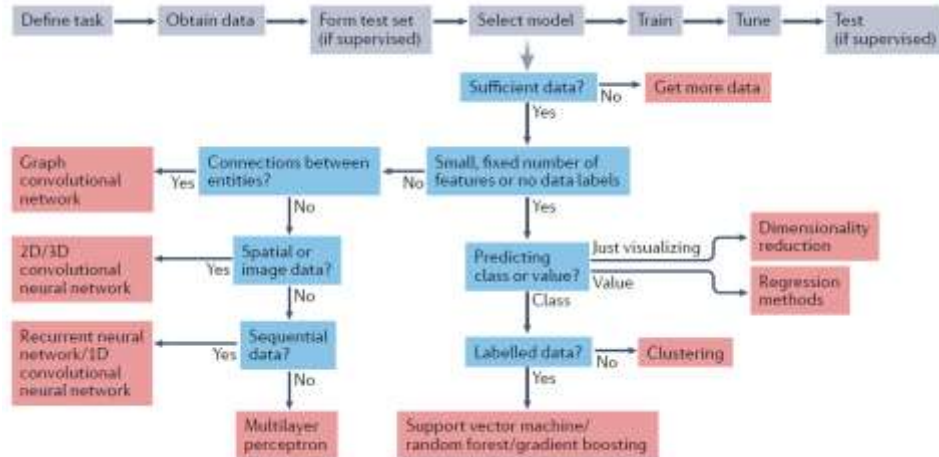

Which algorithm should you use?

- The **size/quality/nature of data**, and the **availability of labels**
- What you want to do with the data
 - Prediction? Description? Data exploration?
- The required computational time
 - Speed/performance on new data?
- **Accuracy and ease of use**
 - Easy to implement? Interpretability?
- **Presence of any type of bias**
 - Class imbalance, annotation bias, aggregation bias, algorithmic bias, demographic bias, distributional shift,

Which algorithm should you use?

- Choosing the right algorithm requires **trading off one benefit against another**, including model speed, accuracy, and complexity
 - **The "best method ever" does not exist**
- **More than one algorithm** should always be tested and compared

The black box metaphor and interpretability

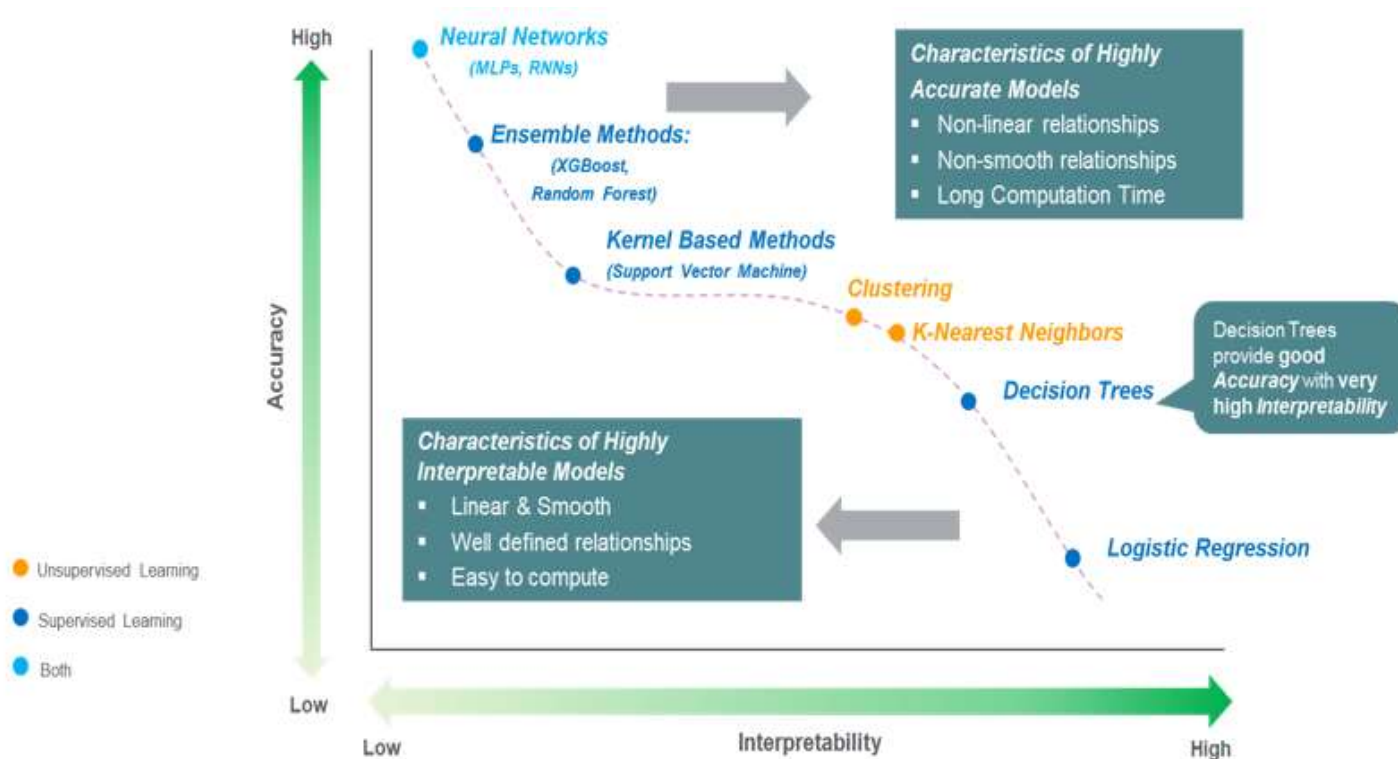

- AI sometimes appears as a kind of magic trick or a **black box**, that is, a system for which we can only observe the inputs and outputs but not the internal workings
 - Thus, it is difficult to figure out **why and how** they behave the way they do
 - The lack on **interpretability** is a major issue in

I think you should be a little more specific, here in Step 2

Interpretability vs accuracy

To conclude

- Artificial intelligence is **transforming the way we process data**, build models, and develop new tools in medical disciplines
- Artificial intelligence applied to **healthcare** requires:
 - issues **awareness**
 - **caution**
 - **transparency**
 - **responsibility**
 - **effective**, yet **understandable** and **interpretable** decision-making tools
 - **concrete impact** on healthcare
 - open and clear **communication with society**

Thanks for your attention!
